

c Aggregate compatibility does not identify a biomarker interaction

24 feasible integer states
30–38 randomized participants
Raw pCR fraction: 48.5–60.0%

Missing: joint phase–marker–outcome mapping
Retain all ten historical comparisons
Do not fit a pseudo-corrected randomized interaction

Conditional on the public Arm 3 set being a subset of the reported combined arm with the same pCR definition.
Dots are feasible counts, not participants. The compatibility range is neither a CI nor a treatment-effect bound.
