a Different units, not a screening denominator

28	historical candidates
22	claim–estimand objects
15	objects with local estimates
27	historical primary model rows

b Separate evidence dimensions

- Published use and source claim
- Evidence design and comparison
- Implementation and provenance
- Population and target estimand
- Current inferential role

c Recoverable rules and unresolved identity require different actions

AVAglio: reconstruct the specified analysis

Recoverable population and covariate rules
A2/A3: same 333 participants, different models
Same-trial sensitivity; no independent validation

TRIO: qualify what can be inferred

Arms 1/2 identifiable by trial design
Arm 3 phase–marker mapping unresolved
Aggregate bounds cannot recover interaction

Historical computations retained; no outcome-driven reselection or replacement denominator.
