

c Missing joint identity prevents a corrected biomarker interaction

24 feasible integer states
30-38 randomized participants
Raw pCR proportion: 48.5-60.0%

Unresolved: phase-marker-outcome mapping
Historical comparison: allocation phase unverified
No pseudo-corrected participant subset is fitted

Assumption: public Arm 3 is a subset of the reported combined arm, with the same endpoint definition.
The 48.5-60.0% compatibility range is not a CI, treatment-effect bound or marker-by-treatment interaction bound.
